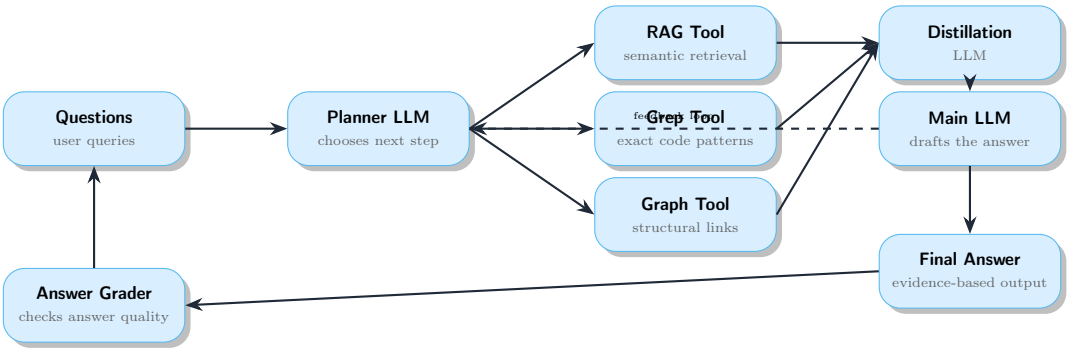
PSC INF01 X24: LLM for Information Extraction in a DSL: Case of Envision (LOKAD)

The INF01 Team

Gaétan Dégot–Silvestre, Yoan Dorchies, Ivann Kamdem, Guilhem Thébault, Adam Guediche

Agentic Pipeline



Project Summary

The INF01 project provides an intelligent assistant designed for the analysis of proprietary code written in **Envision** (Lokad's DSL). The project addresses the opacity of massive codebases by using an agentic architecture capable of:

- **Planning** dynamic multi-step search strategies.
- **Extracting** information via RAG, Static Analysis, and Dependency Graphs.
- **Explaining** the code's internal workings with a verifiable source of truth.

This approach enables increased autonomy for new developers and flattens the learning curve for complex business tools.
